185 grain crop amounted to 119 million tons, and the target for 1950 is set
433 at 127 million metric tons. Production of potatoes in Byelorussia is to increase by 6 per cent., and of flax by 31 percent.

Fishing

•226 Before the war fishing was an important source of food supply in Byelorussia, where the many inland lakes and streams abound in pike, perch, bass, sandre, bream, and other fresh-water fish. Osweia Lake, a body of water about 3,500 acres in extent, produced some 500 tons of fish annually, when 50 men were engaged in year-round fishing. At that time the fishing collective at the lake employed nets measuring almost a mile in overall length; but today very little fishing is being done for lack of nets and other equiptment. Osweia is not an isolated example.

[127] An extensive system of fish culture, including the stocking of fish and the addition of chemical fertilizers to assist plant growth in the lakes, was destroyed during the war. The Germans depleted available fish resources by discharging explosives under water to bring the stunned fish to the surface. Many young fish were exterminated by this method of explosive fishing, without regard to conservation. At present the system of fish culture in Byelorussia is being slowly reinstituted, but is handicapped by the lack of nets. UNRRA shipments of fishing gear have, however, contributed valuable assistance in this regard.

The new Five Year Plan provides that "by 1948, pond culture will be restored to pre-war proportions."

The fish catch in 1950 is expected to be 5,200 tons.
